

Q1. Table: World

```
+-----+-----+
| Column Name | Type   |
+-----+-----+
| name        | varchar |
| continent   | varchar |
| area        | int     |
| population  | int     |
| gdp         | bigint  |
+-----+-----+
```

name is the primary key (column with unique values) for this table.

Each row of this table gives information about the name of a country, the continent to which it belongs, its area, the population, and its GDP value.

A country is **big** if:

- it has an area of at least three million (i.e., 3000000 km²), or
- it has a population of at least twenty-five million (i.e., 25000000).

Write a solution to find the name, population, and area of the **big countries**.

Return the result table in **any order**.

The result format is in the following example.

Example 1:

Input:

World table:

name	continent	area	population	gdp
Afghanistan	Asia	652230	25500100	20343000000
Albania	Europe	28748	2831741	12960000000
Algeria	Africa	2381741	37100000	188681000000
Andorra	Europe	468	78115	3712000000
Angola	Africa	1246700	20609294	100990000000

Output:

name	population	area
Afghanistan	25500100	652230
Algeria	37100000	2381741

Q2. Table: Customer

```
+-----+-----+
| Column Name | Type   |
+-----+-----+
| id          | int    |
| name        | varchar|
| referee_id  | int    |
+-----+-----+
```

In SQL, id is the primary key column for this table. Each row of this table indicates the id of a customer, their name, and the id of the customer who referred them.

Find the names of the customer that are **not referred by** the customer with id = 2.

Return the result table in **any order**.

The result format is in the following example.

Example 1:

Input:

Customer table:

```
+----+-----+-----+
```

id	name	referee_id
1	Will	null
2	Jane	null
3	Alex	2
4	Bill	null
5	Zack	1
6	Mark	2

Output:

name
Will
Jane
Bill
Zack

Q3 .Table: Views

Column Name	Type
-------------	------

```

| article_id | int |
| author_id  | int |
| viewer_id  | int |
| view_date  | date |
+-----+-----+

```

There is no primary key (column with unique values) for this table, the table may have duplicate rows.

Each row of this table indicates that some viewer viewed an article (written by some author) on some date.

Note that equal author_id and viewer_id indicate the same person.

Write a solution to find all the authors that viewed at least one of their own articles.

Return the result table sorted by id in ascending order.

The result format is in the following example.

Example 1:

Input:

Views table:

```

+-----+-----+-----+-----+

```

```

| article_id | author_id | viewer_id | view_date |
+-----+-----+-----+-----+
| 1         | 3         | 5         | 2019-08-01 |
| 1         | 3         | 6         | 2019-08-02 |
| 2         | 7         | 7         | 2019-08-01 |
| 2         | 7         | 6         | 2019-08-02 |
| 4         | 7         | 1         | 2019-07-22 |
| 3         | 4         | 4         | 2019-07-21 |
| 3         | 4         | 4         | 2019-07-21 |
+-----+-----+-----+-----+

```

Output:

```

+-----+
| id   |
+-----+
| 4    |
| 7    |
+-----+

```

Q4. Create a 'Product' table

Field name	Data Type	Constraint
P_id	Varchar(50)	Primary Key
Product_name	Varchar(50)	Not Null
Manufacture	Varchar(50)	Not Null
Price	int	Not Null

Q5. Insert below record into 'product' table

Pid	Productname	Manufacture	Price
P001	Moisturiser	XYZ	100
P002	Sanitizer	LAC	50
P003	Bath Soap	COP	150
P004	Shampoo	TAP	200
P005	Lens Solution	COP	150

Q6. Write a query to calculate avg of product price

Having price between 100 and 200.

Q7. Write a query to calculate sum of product price from product table.

Q8. Write a query to double product price from product table where productname = Lens Solution.

Q9. Write a query to decrease product price from product table where productname = sanitizer or Bath soap.

Q10. Create two table such as 'Mother' and 'Baby'

"Mother" Table

Field Name	Data Type	Constraint
Mid	int	Primary Key
Mname	Varchar(50)	Not null

Q 11 "Baby" Table

Field Name	Data Type	Constraint
bid	int	Primary key
bname	Varchar(50)	Not null
mid	int	Foreign key

Q12. Insert record into 'Mother 'table as below

01	Kajol
02	Madhuri
03	Alia

Q13. Insert record into 'baby ' table as below

01	'Nysa'	01
02	'Yug'	01
03	'raha'	03
04	'Aryn'	02
05	'Ryan'	02

Q14. Write a Query to create view on table 'mother' as 'mother_view' copy all the data from mother table.

Q15. Write a Query to create a View on Product table as 'Product_views' just copy two column from product table such price and product name.

Q16. Write a Query to fetch record from table 'Product'
Product name start with 's'

Q17. Write a Query to fetch record from table 'Product'
Product name ends with 'r'

Q18. Write a Query to fetch record from table 'Product'
Product name start 's' and ends with 'o'.

Q19. Display All record from table Product.

Q20. Display all record from table 'Mother' and 'Baby'.
